Assignment 30 - Calculated Fields, Parameters & LOD Expressions

Question 1: What is a Calculated Field and why is it important in business dashboards?

Answer:

Calculated Field:

A **Calculated Field** in Tableau is a custom formula created using existing data fields.

Example:
Profit = Sales – Cost

<u>Importance:</u>

- Helps create new insights from existing data
- Used for business logic (like profit, ratio, classification)
- Makes dashboards more dynamic and meaningful
- Reduces dependency on raw dataset changes

Question 2: Why can't parameters change visuals directly in Tableau?

Name: Prarabdh Srivastava
Batch: Data Analytics Dec Live Batch

Answer:

Parameters **do not directly affect visuals** because they are just input values.

They work **only when used with calculated fields, filters, or reference lines**.

Example:

- Parameter = "Top 5 / Top 10"
- It needs a calculated field to update the chart

Q3: When should EXCLUDE LOD be used?

Answer:

Use **EXCLUDE LOD** when you want to **remove a dimension from the view level**.

Example:

- Suppose we are viewing sales by **Category + Product**
- But we want total sales **only by Category**

Syntax:

Name: Prarabdh Srivastava
Batch: Data Analytics Dec Live Batch

```
{EXCLUDE [Product Name]:
SUM(Sales)}
```

Question 4: Difference between FIXED and INCLUDE LOD expressions?

Answer:

Feature	FIXED	INCLUDE
Dependency	Independent of view	Depends on view
Use Case	Fixed calculation	Add extra detail
Filters	Ignores most filters	Respects filters
Example	City-wise avg sales	Product-level avg
